# Experiment No 5

## Domain Information Gathering: WHOIS, DNS Records and Diagnostics

## Aim

To examine publicly available domain registration information, DNS records, and basic network diagnostics for the domain shown in the supplied screenshots.

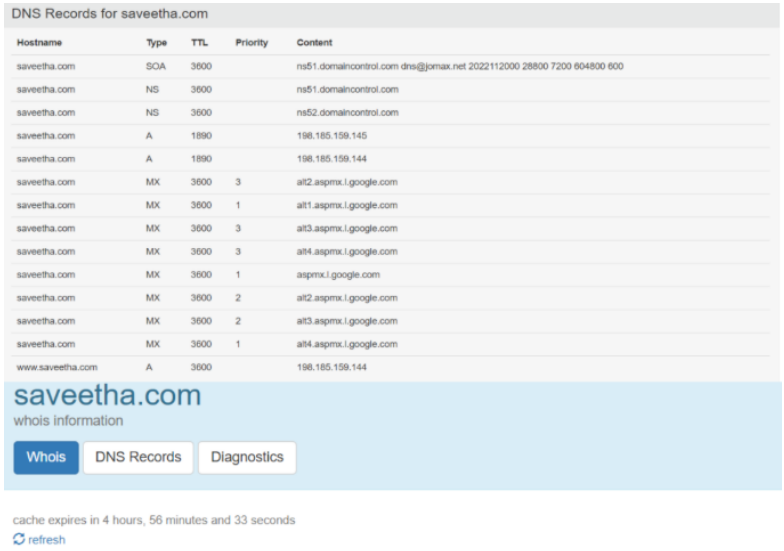

## Algorithm

1. Open a web browser in Kali Linux and access the domain lookup/diagnostics tool.
2. Enter the domain **saveetha.com** and open the DNS Records section.
3. Observe the listed SOA, NS, A, and MX records and their associated values.
4. Open the WHOIS section and review registrar information, important dates, and name servers.
5. Open the Diagnostics section and inspect the ping statistics and traceroute output.
6. Capture the results and record the observations.

## Output

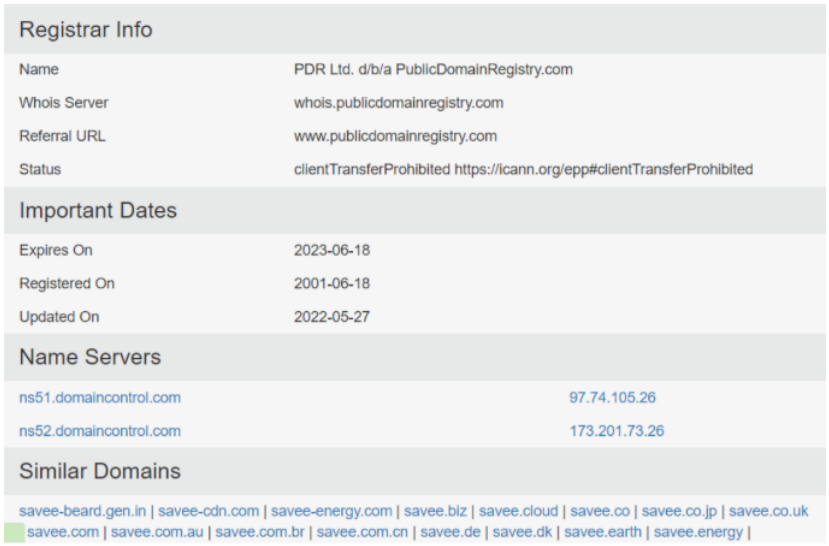

Screenshots supplied for Experiment 5 are reproduced below.

## Output Screenshot 1

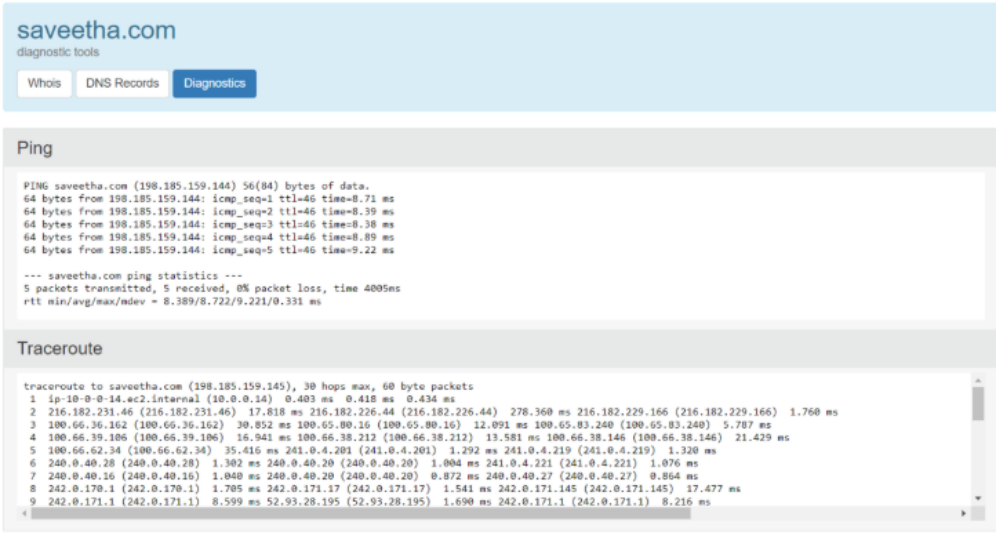

*DNS records for saveetha.com, including SOA, NS, A and MX entries.*

## Output Screenshot 2

*WHOIS/registrar details, important dates, name servers and similar-domain information.*

## Output Screenshot 3

*Network diagnostics showing ping statistics and traceroute results.*

## Result

Thus, domain information gathering for saveetha.com was demonstrated using DNS record lookup, WHOIS information, and network diagnostics. The screenshots display DNS records, registrar/name-server details, ping responses, and traceroute hops.
